PrepNova Overall Test Report

29 October 2026 | Frontend, backend, database-backed API, AI evaluation, production build

Summary

The production frontend build completed, ESLint passed, backend JavaScript syntax checks passed, and the built site plus its main JavaScript and CSS assets loaded from Vite preview with HTTP 200 responses.

The API report records 56 passed checks and one intentionally skipped operation. Interview completion returned an AI-sourced evaluation. The global leaderboard reset was not run because it changes shared data.

Test results

Frontend build

npm run build passed.

Frontend lint

npm run lint passed after fixing declaration order in SwipeSubmitButton.

Backend syntax

All server/src JavaScript files passed node --check.

Production preview

Built HTML, JavaScript bundle, and stylesheet returned HTTP 200.

API and database

56 checks passed; one global leaderboard reset intentionally skipped.

AI evaluation

Interview completion returned source=ai, five question evaluations, and no provider error.

Build note: Vite reports a non-blocking generated JavaScript chunk above 500 kB after minification. The main bundle was about 863 kB.

Coverage limits

The leaderboard reset endpoint was reviewed but not invoked because it mutates shared data.

No frontend unit or browser end-to-end test runner was found. Manual browser checks for responsive layouts, themes, keyboard accessibility, and navigation were not performed.

PDF and DOCX interview downloads compile but were not downloaded and inspected in a browser.

Speech transcription received an invalid-payload check only; no real audio was submitted.

Production hosting, concurrent-user load, and deployment configuration were not tested.

Overall status

Core automated checks passed: the frontend builds and lints, backend source parses, the production preview serves, and the recorded API suite passed. Browser interactions, real audio transcription, report downloads, and performance remain unverified.
